# SaraMedico - Hospital Dashboard API Integration Guide

This document maps the Hospital Dashboard UI sections to their corresponding backend APIs. All endpoints (except registration and login) require a valid JWT token in the `Authorization` header ( `Bearer <token>` ) belonging to a user with the `hospital` or `admin` role.

## Table of Contents

1. Onboarding & Authentication
2. Home / Overview Page
3. Directory Page
4. Appointments & Calendar
5. Patients Page
6. Staff Management Page
7. Global Sidebar Actions

## 1. Onboarding & Authentication

### Register a New Hospital

Used when a new clinic/hospital is signing up for the platform. It creates the organization and the root admin account.

- **Endpoint:** `POST /api/v1/auth/register/hospital`
- **Payload:**

```
{
  "organization_name": "Metro City Hospital",
  "admin_name": "Jane Doe",
  "email": "admin@metrocity.com",
  "phone_number": "+1234567890",
  "password": "SecurePassword123!"
}
```

### Admin Login

Used to get the JWT token for all subsequent requests.

- **Endpoint:** `POST /api/v1/auth/login`
- **Content-Type:** `application/x-www-form-urlencoded` (OAuth2 standard)
- **Payload:** `username=admin@metrocity.com&password=SecurePassword123!`

## 2. Home / Overview Page

Populates the main dashboard cards and the "Recent Activities" list.

- **Endpoint:** `GET /api/v1/hospital/dashboard/overview`
- **Response:**

```
{
  "metrics": {
    "totalDoctors": 24,
    "todayAppointments": 18
  },
  "recentActivities": [
    {
      "activityId": "uuid-string",
      "activityType": "staff_invitation",
      "subject": "dr.smith@example.com",
      "status": "pending",
      "timestamp": "2026-03-05T09:30:00Z"
    }
  ]
}
```

### 3. Directory Page

Fetches the complete list of all doctors and patients in the organization. The frontend can use this to render unified or tabbed directory tables., Remove the Approval Queue section and rename it to the directory page, this will only show the table of patients and doctors with the below information.

- **Endpoint:** `GET /api/v1/hospital/directory`
- **Response:**

```
{
  "doctors": [
    {
      "id": "uuid-string",
      "name": "Dr. Sarah Smith",
      "email": "sarah.smith@metrocity.com",
      "specialty": "Cardiology",
      "phone": "+1234567890",
      "joinedAt": "2026-02-15T08:30:00Z"
    }
  ],
  "patients": [
    {
      "id": "uuid-string",
      "name": "John Doe",
      "mrn": "MRN-A1B2C3",
      "gender": "Male",
      "dateOfBirth": "1990-05-12",
      "joinedAt": "2026-03-01T14:20:00Z"
    }
  ]
```

```
}
```

## 4. Appointments & Calendar

To render the month calendar view, use the existing organization-wide calendar endpoint.

- **Endpoint:** `GET /api/v1/calendar/organization/events`
- **Query Parameters:**
  - `start_date` : Start of the calendar grid (e.g., `2026-03-01T00:00:00Z` )
  - `end_date` : End of the calendar grid (e.g., `2026-03-31T23:59:59Z` )
  - `event_type` : Use `appointment` to only show consultations.
- **Example Request:** `/api/v1/calendar/organization/events?start_date=2026-03-01T00:00:00Z&end_date=2026-03-31T23:59:59Z&event_type=appointment`
- **Response:** Returns a flat array of events. The frontend should use the `start_time` to group them onto the correct calendar days. It includes `metadata.appointment_status` and `metadata.zoom_link` for rendering UI badges/buttons.

## 5. Patients Page

Populates the 3 top metrics cards and the full patient table (including the dynamically calculated "Last Visit" date).

- **Endpoint:** `GET /api/v1/hospital/patients`
- **Response:**

```
{
  "metrics": {
    "activePatients": 142,
    "patientsToday": 8,
    "pendingPatients": 4
  },
  "patients": [
    {
      "id": "uuid-string",
      "mrn": "MRN-A1B2C3",
      "name": "John Doe",
      "gender": "Male",
      "lastVisit": "2026-02-28T14:30:00Z"
    }
  ]
}
```

## 6. Staff Management Page

### Fetch Staff Data

Populates the total staff card and the detailed staff table.

- **Endpoint:** `GET /api/v1/hospital/staff`
- **Response:**

```
{
  "metrics": {
    "totalStaff": 25
  },
  "staff": [
    {
      "id": "uuid-string",
      "name": "Dr. Sarah Smith",
      "role": "Doctor",
      "specialty": "Cardiology",
      "email": "sarah@metrocity.com",
      "phone": "+1234567890",
      "status": "Active"
    }
  ]
}
```

#### "Invite Doctor" Button

Action to invite a new staff member to the organization.

- **Endpoint:** `POST /api/v1/team/invite`
- **Payload:**

```
{
  "email": "new.doctor@metrocity.com",
  "full_name": "Dr. John Watson",
  "role": "MEMBER"
}
```

*(Note: Send `"MEMBER"` for Doctors, `"ADMINISTRATOR"` for other hospital managers).*

## 7. Global Sidebar Actions

#### "Create Event" Button

Creates a general, non-patient event on the hospital calendar (e.g., Staff Meeting).

- **Endpoint:** `POST /api/v1/calendar/events`
- **Payload:**

```
{
  "title": "Weekly Staff Meeting",
  "description": "Discussing new shift schedules.",
  "start_time": "2026-03-10T14:00:00Z",
  "end_time": "2026-03-10T15:30:00Z",
  "all_day": false,
```

```
    "color": "#10B981",
    "reminder_minutes": 30
  }
```

**"Create Task" Button**

Assigns a to-do item. The backend will *automatically* generate a calendar event for the `due_date`, so the frontend does not need to call the calendar API separately.

- **Endpoint:** `POST /api/v1/tasks`
- **Payload:** ```json { "title": "Review Compliance Report", "description": "Check Q1 HIPAA
